

# *The Entity-Relationship Model*

## Chapter 2

# Overview of Database Design

- ❖ Conceptual design: (*ER Model is used at this stage.*)
  - What are the *entities* and *relationships* in the enterprise?
  - What information about these entities and relationships should we store in the database?
  - What are the *integrity constraints* or *business rules* that hold?
  - A database 'schema' in the ER Model can be represented pictorially (*ER diagrams*).
  - Can map an ER diagram into a relational schema.

# ER Model Basics

- ❖ Entity: Real-world object distinguishable from other objects. An entity is described (in DB) using a set of attributes.
- ❖ Entity Set: A collection of similar entities. E.g., all employees.
  - All entities in an entity set have the same set of attributes. (Until we consider ISA hierarchies, anyway!)
  - Each entity set has a *key*.
  - Each attribute has a *domain*.

# ER Model Basics (Contd.)

- ❖ **Relationship**: Association among two or more entities.  
E.g., Attishoo works in Pharmacy department.
- ❖ **Relationship Set**: Collection of similar relationships.
  - An n-ary relationship set  $R$  relates  $n$  entity sets  $E_1 \dots E_n$ ; each relationship in  $R$  involves entities  $e_1 \in E_1, \dots, e_n \in E_n$ 
    - Same entity set could participate in different relationship sets, or in different “roles” in same set.

# Key Constraints

- ❖ Consider Works\_In:  
An employee can work in many departments; a dept can have many employees.
- ❖ In contrast, each dept has at most one manager, according to the key constraint on **Manages**.

1-to-1

1-to Many

Many-to-1

Many-to-Many

# Participation Constraints

- ❖ Does every department have a manager?
  - If so, this is a participation constraint: the participation of Departments in Manages is said to be *total* (vs. *partial*).
    - Every Departments entity must appear in an instance of the Manages relationship.

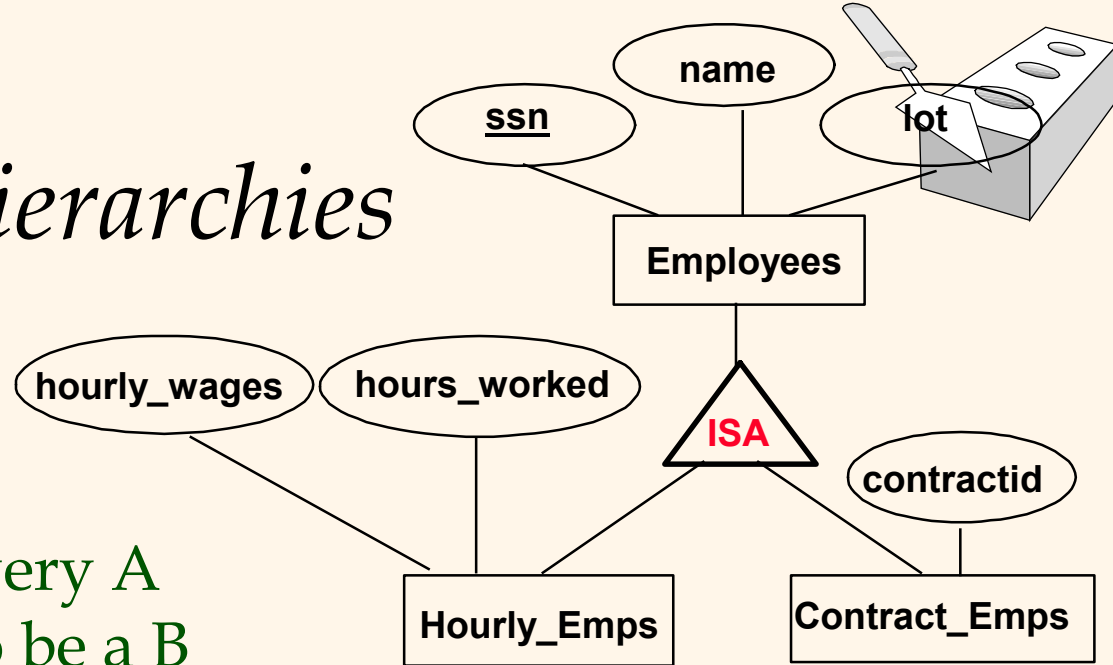

# Weak Entities

- ❖ A *weak entity* can be identified uniquely only by considering the primary key of another (*owner*) entity.
  - Owner entity set and weak entity set must participate in a one-to-many relationship set (one owner, many weak entities).
  - Weak entity set must have total participation in this *identifying* relationship set.

# ISA ('is a') Hierarchies

- ❖ As in C++, or other PLs, attributes are inherited.
- ❖ If we declare A **ISA** B, every A entity is also considered to be a B entity.

- ❖ *Overlap constraints*: Can Joe be an Hourly\_Emps as well as a Contract\_Emps entity? (*Allowed/disallowed*)
- ❖ *Covering constraints*: Does every Employees entity also have to be an Hourly\_Emps or a Contract\_Emps entity? (*Yes/no*)
- ❖ Reasons for using ISA:
  - To add descriptive attributes specific to a subclass.
  - To identify entities that participate in a relationship.

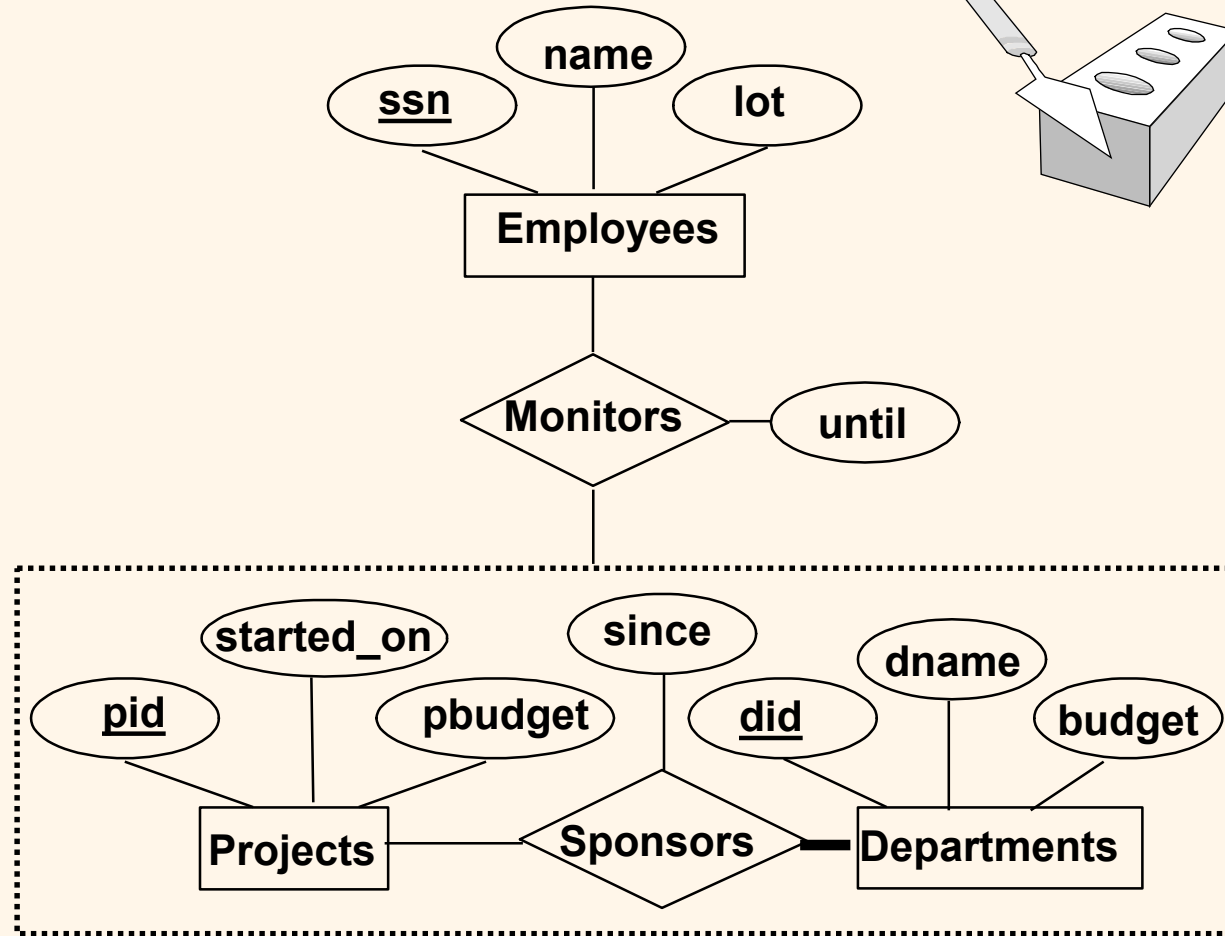

# Aggregation

- ❖ Used when we have to model a relationship involving (entity sets and) a *relationship set*.

- Aggregation allows us to treat a relationship set as an entity set for purposes of participation in (other) relationships.

\* *Aggregation vs. ternary relationship:*

- ❖ Monitors is a distinct relationship, with a descriptive attribute.
- ❖ Also, can say that each sponsorship is monitored by at most one employee.

# *Conceptual Design Using the ER Model*

## ❖ Design choices:

- Should a concept be modeled as an entity or an attribute?
- Should a concept be modeled as an entity or a relationship?
- Identifying relationships: Binary or ternary? Aggregation?

## ❖ Constraints in the ER Model:

- A lot of data semantics can (and should) be captured.
- But some constraints cannot be captured in ER diagrams.

# *Entity vs. Attribute*

- ❖ Should *address* be an attribute of Employees or an entity (connected to Employees by a relationship)?
- ❖ Depends upon the use we want to make of address information, and the semantics of the data:
  - If we have several addresses per employee, *address* must be an entity (since attributes cannot be set-valued).
  - If the structure (city, street, etc.) is important, e.g., we want to retrieve employees in a given city, *address* must be modeled as an entity (since attribute values are atomic).

# Entity vs. Attribute (Contd.)

- ❖ Works\_In4 does not allow an employee to work in a department for two or more periods.

- ❖ Similar to the problem of wanting to record several addresses for an employee: We want to record *several values of the descriptive attributes for each instance of this relationship*. Accomplished by introducing new entity set, **Duration**.

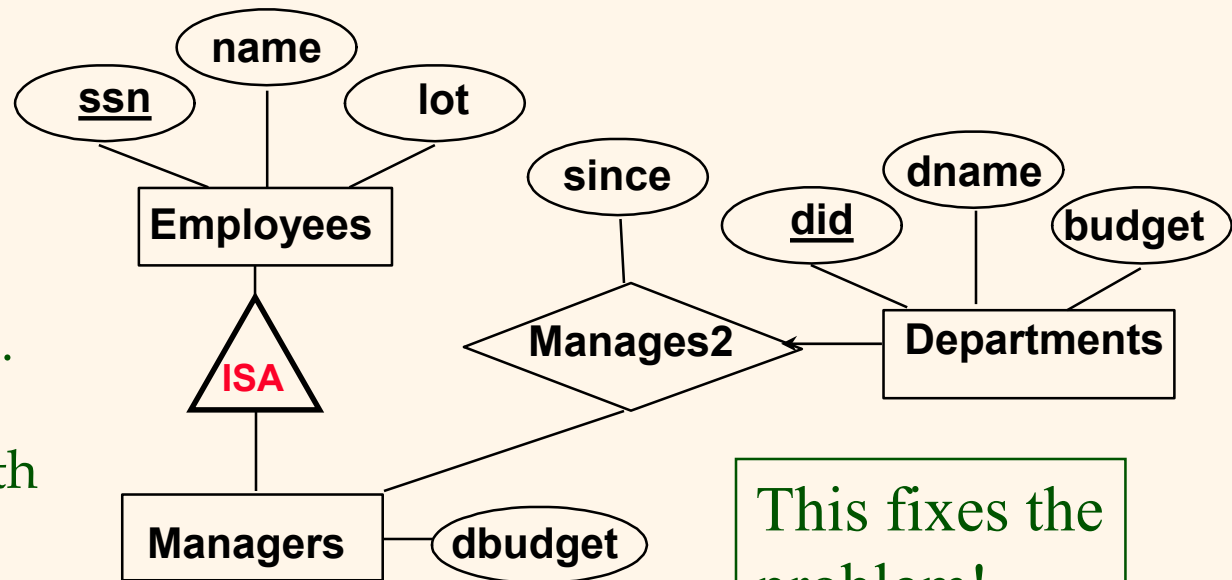

# Entity vs. Relationship

- ❖ First ER diagram OK if a manager gets a separate discretionary budget for each dept.
- ❖ What if a manager gets a discretionary budget that covers *all* managed depts?

- **Redundancy:** *dbudget* stored for each dept managed by manager.
- **Misleading:** Suggests *dbudget* associated with department-mgr combination.

This fixes the problem!

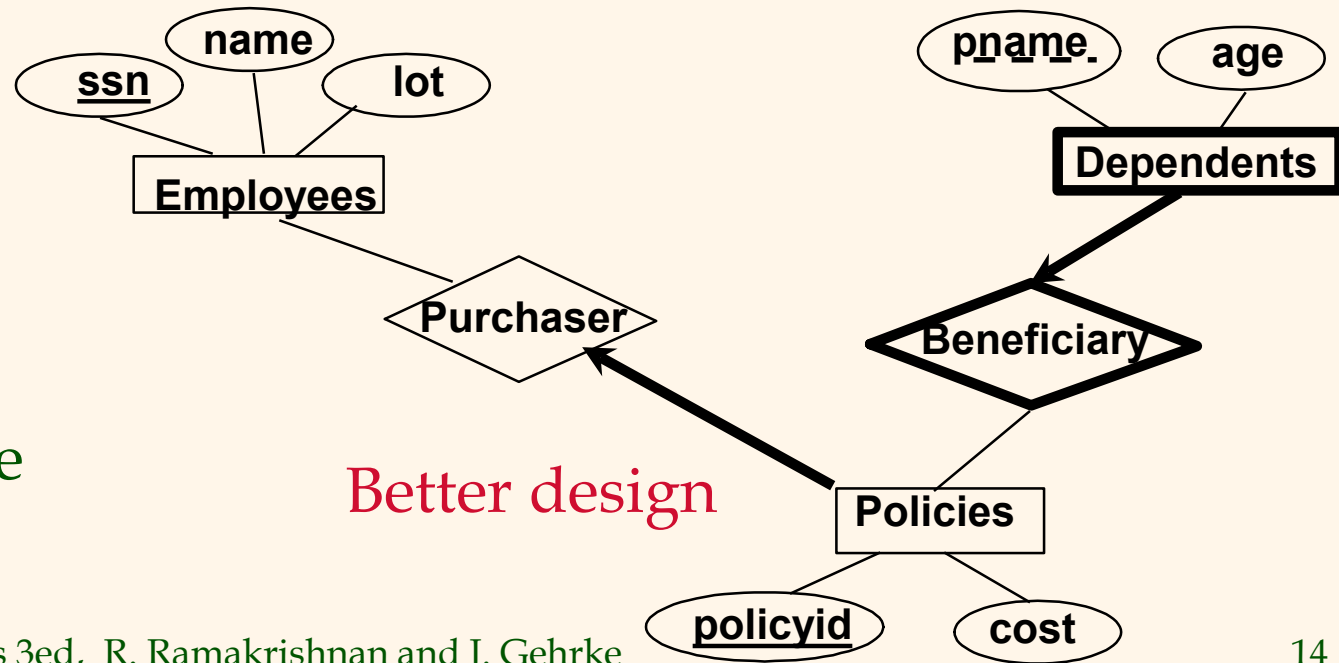

# Binary vs. Ternary Relationships

- ❖ If each policy is owned by just 1 employee, and each dependent is tied to the covering policy, first diagram is inaccurate.

- ❖ What are the additional constraints in the 2nd diagram?

## *Binary vs. Ternary Relationships (Contd.)*

- ❖ Previous example illustrated a case when two binary relationships were better than one ternary relationship.
- ❖ An example in the other direction: a ternary relation **Contracts** relates entity sets **Parts**, **Departments** and **Suppliers**, and has descriptive attribute *qty*. No combination of binary relationships is an adequate substitute:
  - S “can-supply” P, D “needs” P, and D “deals-with” S does not imply that D has agreed to buy P from S.
  - How do we record *qty*?

# *Summary of Conceptual Design*

- ❖ *Conceptual design follows requirements analysis,*
  - Yields a high-level description of data to be stored
- ❖ ER model popular for conceptual design
  - Constructs are expressive, close to the way people think about their applications.
- ❖ Basic constructs: *entities, relationships, and attributes* (of entities and relationships).
- ❖ Some additional constructs: *weak entities, ISA hierarchies, and aggregation.*
- ❖ Note: There are many variations on ER model.

## *Summary of ER (Contd.)*

- ❖ Several kinds of integrity constraints can be expressed in the ER model: *key constraints, participation constraints, and overlap/covering constraints* for ISA hierarchies. Some *foreign key constraints* are also implicit in the definition of a relationship set.
  - Some constraints (notably, *functional dependencies*) cannot be expressed in the ER model.
  - Constraints play an important role in determining the best database design for an enterprise.

## *Summary of ER (Contd.)*

- ❖ ER design is *subjective*. There are often many ways to model a given scenario! Analyzing alternatives can be tricky, especially for a large enterprise. Common choices include:
  - Entity vs. attribute, entity vs. relationship, binary or n-ary relationship, whether or not to use ISA hierarchies, and whether or not to use aggregation.
- ❖ Ensuring good database design: resulting relational schema should be analyzed and refined further. FD information and normalization techniques are especially useful.
