Entity / Relationship Model

Fei Deng

Mon 10AM – 11AM, Hill 202

fei.deng@rutgers.edu

Degree Constraints

- This **many-one relationship** specifies that a paper can be published in **at most one** conference
- However, it does not specify how many papers a conference can accept
- If each conference accepts at most 100 papers, we may want to represent such constraint in the diagram

Degree Constraints

Degree Constraints

Papers	Conferences
paper1	conf1
paper2	conf1
paper3	conf3
paper4	conf2
paper5	conf1
paper6	conf2

Each paper appears at most once
Each conference appears at most 100 times

Each node has
at most one
connection

Each node has
at most 100
connections

Total Participation

Papers	Authors
paper1	author1
paper1	author2
paper2	author3
paper3	author1
paper3	author4
paper4	author2

Each paper must appear at least once

The participation of *Papers* in *Written by* is total

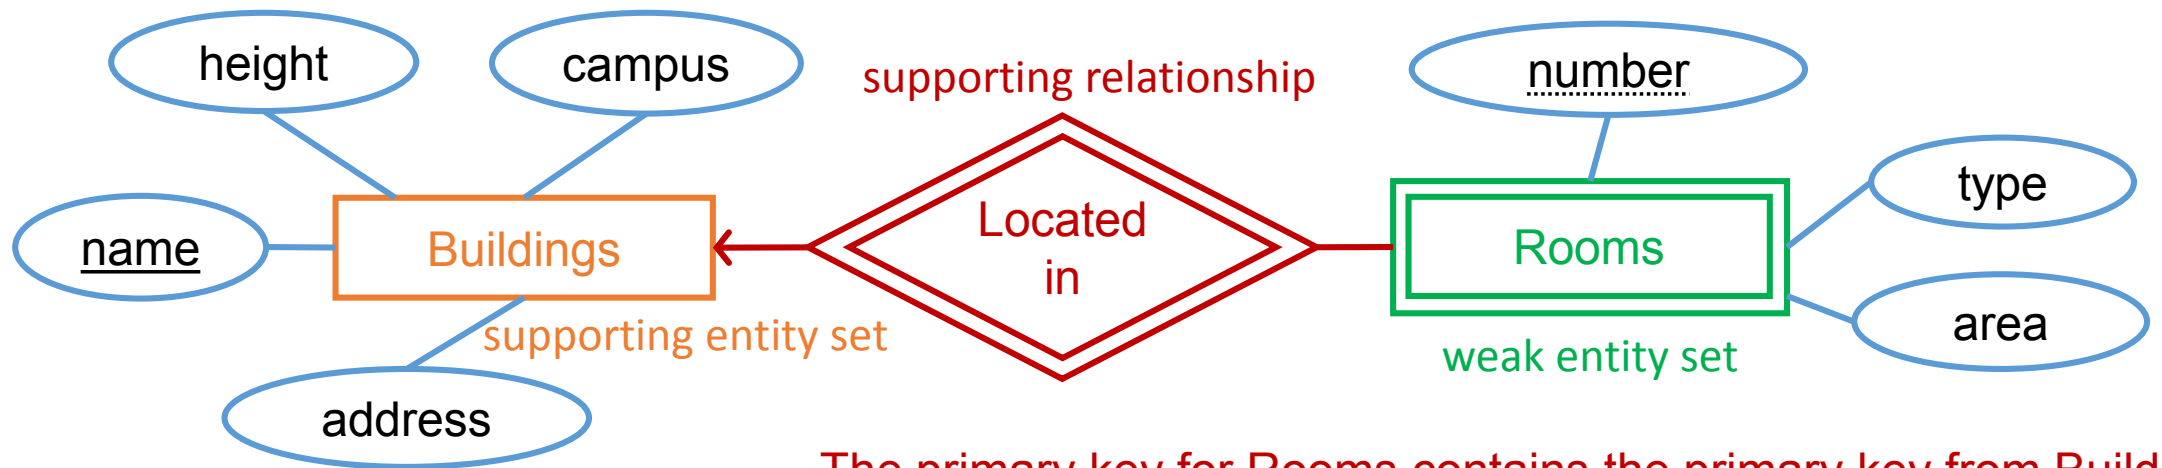

Total Participation

- If E has **total participation** in R, and R is **many-one** from E to F, then each member of E connects to **exactly one** member of F

Weak Entity Sets

- Supporting relationship must be “many to exactly one”

The primary key for Rooms contains the primary key from Buildings

<u>name</u>	<u>number</u>	type
Hill Center	202	TA office
Tillett Hall	202	classroom

Subclasses

- Think of subclasses as subsets: $E \subseteq G, F \subseteq G$

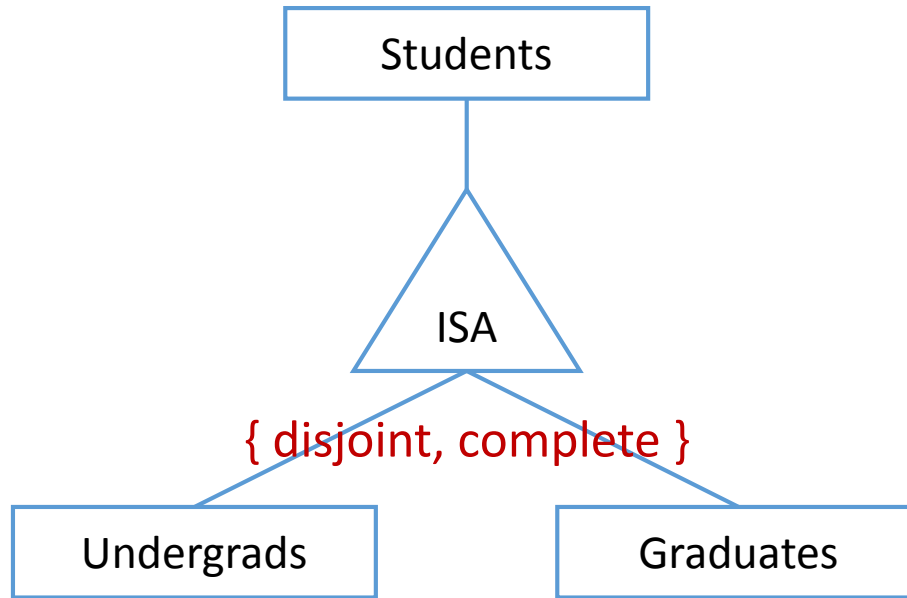

Disjoint constraint:
 $E \cap F = \emptyset$

Complete constraint:
 $E \cup F = G$

Subclasses

$$\begin{aligned} \textit{Undergrads} \cap \textit{Graduates} &= \emptyset \\ \textit{Undergrads} \cup \textit{Graduates} &= \textit{Students} \end{aligned}$$

Aggregation

- Treat a relationship and its participating entity sets as a single virtual entity set

Simple University Database

- Students (sid, sname)
- PhD_Students (sid, sname)
- Professors (pname)
- Departments (dname)
- Courses (cno, cname)
- Sections (sectno)
